## 1) Instances, Variants and Substitutions

- Suppose  $\Theta_1$  and  $\Theta_2$  are substitutions and there exist substitutions  $\sigma_1$  and  $\sigma_2$ , such that  $\Theta_1 = \Theta_2 \sigma_1$  and  $\Theta_2 = \Theta_1 \sigma_2$ . Show that there exists a variable-pure substitution  $\gamma$ , such that  $\Theta_1 = \Theta_2 \gamma$ .

From  $\Theta_1 = \Theta_2 \sigma_1$  and  $\Theta_2 = \Theta_1 \sigma_2$  follows that  $\Theta_1 = \Theta_1 \sigma_2 \sigma_1$ . Let  $\gamma'$  be  $\sigma_1 \sigma_2$  with the domain restricted to  $\text{var}(\Theta_1)$ . Obviously  $\gamma'$  is variable pure. From  $\rho_1 \rho_2$  variable pure follows  $\rho_1$  and  $\rho_2$  are also variable pure. Hence, there must be a variable pure restriction  $\gamma$  of  $\sigma_1$  to the domain  $\text{var}(\Theta_2)$ .

- Which of the following clauses are Instances or Variants of each other?

- $p(x, y, z) :- q(x, y), r(f(z))$
- $p(x, b, f(z)) :- q(x, b), r(f(f(z)))$
- $p(v, w, f(z)) :- q(v, b), r(f(f(z)))$
- $p(z, w, v) :- q(z, w), r(f(v))$
- $p(f(x), y, f(z)) :- q(f(x), y), r(f(f(z)))$
- $p(f(x), y, z) :- q(f(x), y), r(f(z))$

Instance / variant of	1	2	3	4	5	6
1	v	-	-	v	-	-
2	i	v	i	i	-	-
3	i	i	v	i	-	-
4	v	-	-	v	-	-
5	i	i	-	i	v	i
6	i	-	-	i	-	v

2) The following Lemma shows that we only need to deal with Herbrand interpretations in order to find a model for any logic program:

Let  $C$  be a set of clauses and  $\Sigma$  be any signature containing all symbols used in  $C$ . The grounding of  $C$  with respect to  $\Sigma$ , denoted  $C^*$  is the set of all ground instances of the signature  $\Sigma$  of clauses in  $C$ . Let  $I$  be an Herbrand interpretation and  $C$  be a set of clauses.

Prove that  $I \models C$  if and only if  $I \models C^*$ .

a)  $I \models C^* \rightarrow I \models C$ .

Assume  $I \models C^*$ . Without limiting generality we assume that for any two clauses  $C_1$  and  $C_2$  in  $C$ , the sets of variables used in  $C_1$  and  $C_2$  are disjoint. Let  $\sigma$  be any ground substitution over  $\Sigma$ . Then  $C\sigma \subseteq C^*$ . Hence, it is clear that  $I \models C\sigma$ . As we can choose any  $\sigma$ , it follows that  $I \models C$ .

a)  $I \models C \rightarrow I \models C^*$ .

Assume  $I \models C$ , but not  $I \models C^*$ . Without limiting generality we assume that for any two clauses  $C_1$  and  $C_2$  in  $C$ , the sets of variables used in  $C_1$  and  $C_2$  are disjoint. Let  $\sigma$  be any ground substitution over  $\Sigma$ . Then  $C\sigma \subseteq C^*$ . It is clear that  $I \models C\sigma$ . As  $C^*$  is the set of all ground instances of the signature  $\Sigma$  of clauses in  $C$ , there must be some  $\sigma$  for every clause  $C_1$  in  $C^*$ , such that  $C_1 = C\sigma$ . Then, however,  $I \models C_1$ , which is in conflict with our assumption.

### 3) Program Completion

1. Let the definition of a predicate symbol  $p$  be

$p(y) :- q(y), \text{ not } r(a,y).$   
 $p(f(z)) :- \text{ not } q(z).$   
 $p(b).$

Give a completion of  $p$ .

- $p(X) :- (X = y), q(y), \text{ not } r(a,y).$   
 $p(X) :- (X = f(z)), \text{ not } q(z).$   
 $p(X) :- (X = b).$
- $p(X) :- \exists y (X = y), q(y), \text{ not } r(a,y).$   
 $p(X) :- \exists z (X = f(z)), \text{ not } q(z).$   
 $p(X) :- (X = b).$
- $p(X) :- \exists y (X = y), q(y), \text{ not } r(a,y) \vee \exists z (X = f(z)), \text{ not } q(z) \vee (X = b).$
- $p(X) = \exists y (X = y), q(y), \text{ not } r(a,y) \vee \exists z (X = f(z)), \text{ not } q(z) \vee (X = b).$

2. Let  $P$  be a normal program and  $\text{comp}(P)$  it's completion. Prove that  $P$  is a logical consequence of  $\text{comp}(P)$ . Hint:  $P$  is a logical consequence of  $\text{comp}(P)$  if

$$I \models \text{comp}(P) \rightarrow I \models P$$

Let  $I$  be a model of  $\text{comp}(P)$ .  $P$  is a logical consequence of  $\text{comp}(P)$  if  $I \models \text{comp}(P) \rightarrow I \models P$ . As  $I$  models  $\text{comp}(P)$ , every clause  $C$  in  $\text{comp}(P)$  is true in  $I$ . Now we apply the completion backwards:

Replace every  
 $A = G_1 \vee \dots \vee G_n$   
by  
 $A \rightarrow G_1 \vee \dots \vee G_n.$   
 $G_1 \vee \dots \vee G_n \rightarrow A.$

Clearly,  $I$  is also a model for the resulting program.  
As for all clauses  $C$  in a program  $P$   $I \models P \rightarrow I \models C$ , in the following we ignore  
 $A \rightarrow G_1 \vee \dots \vee G_n.$

Then replace every  
 $G_1 \vee \dots \vee G_n \rightarrow A.$   
by  
 $G_1 \rightarrow A.$   
...  
 $G_n \rightarrow A.$

Clearly,  $I$  is also a model for the resulting program  $P'$ .  
Each  $G_i$  in  $\text{comp}(P)$  results from a clause in  $P$ .  $I$  only contains ground instances of clauses in  $P$ . Now let  $G$  be the clause in  $P$ ,  $G_i$  results from. As  $I$  is a model for  $P'$ , all equalities and existentials in  $G_i$  must hold. We obtain a ground program  $P''$  by removing all equalities and existentials from  $P'$ . As  $P''$  is more general than  $P'$ , obviously  $I \models P''$ . As the last step reverses the first two steps of the completion,  $P''$  is a ground instantiation of  $P$ , hence  $I \models P$ .
